

Crime analysis key findings

Aastad ja kuritööd (1.Notebook - Kirke Kisand)

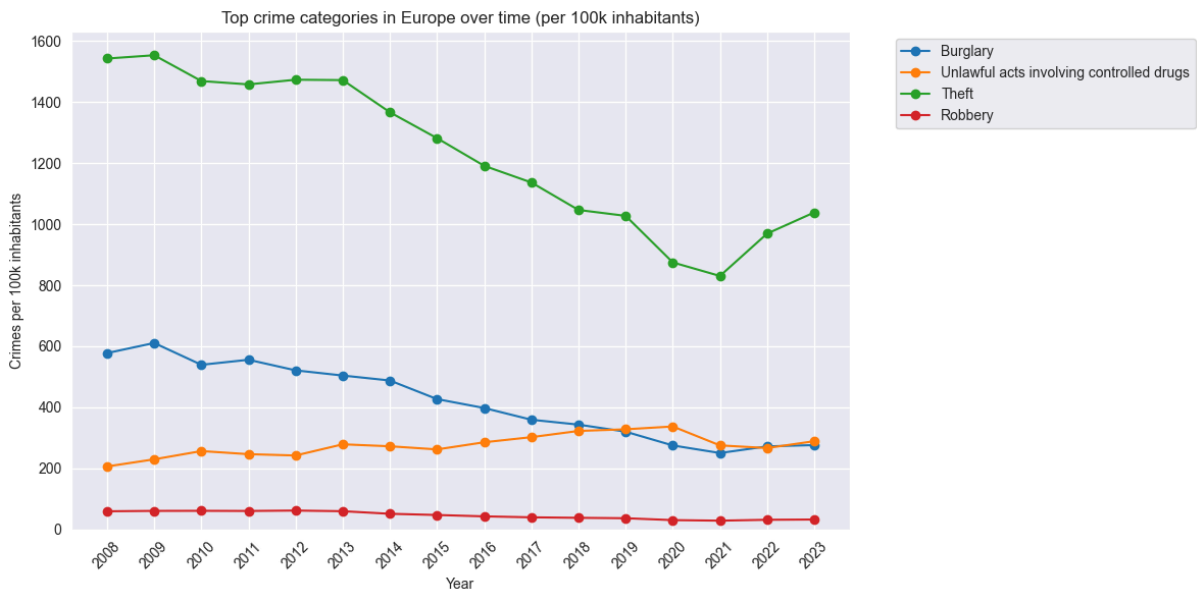

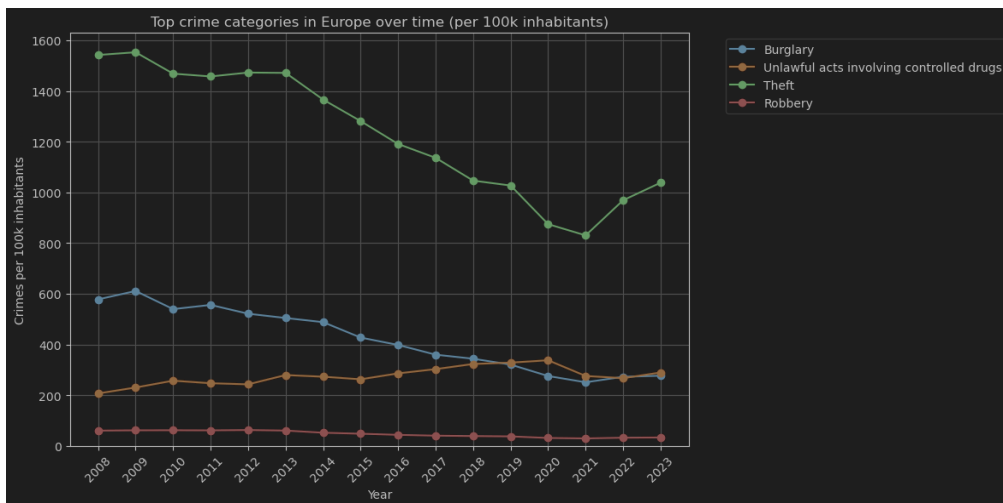

Heatmap, mis näitab, kui mitu korda eelmise aastaga võrreldes crime rate per hundred thousand inhabitants muutus. Ehk siis roheline - kuritegevus vähenes võrreldes eelmise aastaga, punane - kuritegevus tõusis. Kõik sexual violence kategooriad + drugs üldpildis tõusevad, muud üldpildis langevad. Viimastel aastatel vargused ja röövid jälle tõusnud, potentsiaalselt seotud sellega, et inimesed peale koroonat jälle avalikes kohtades käima hakkasid ja turism ellu ärkas.

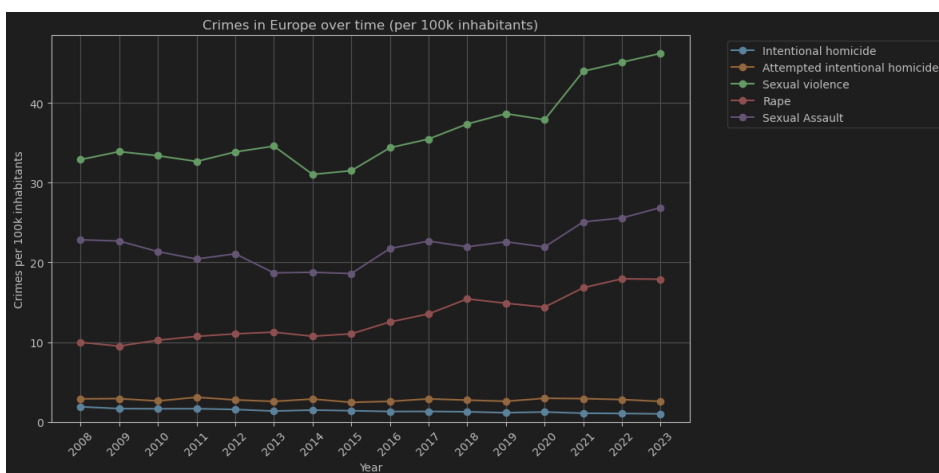

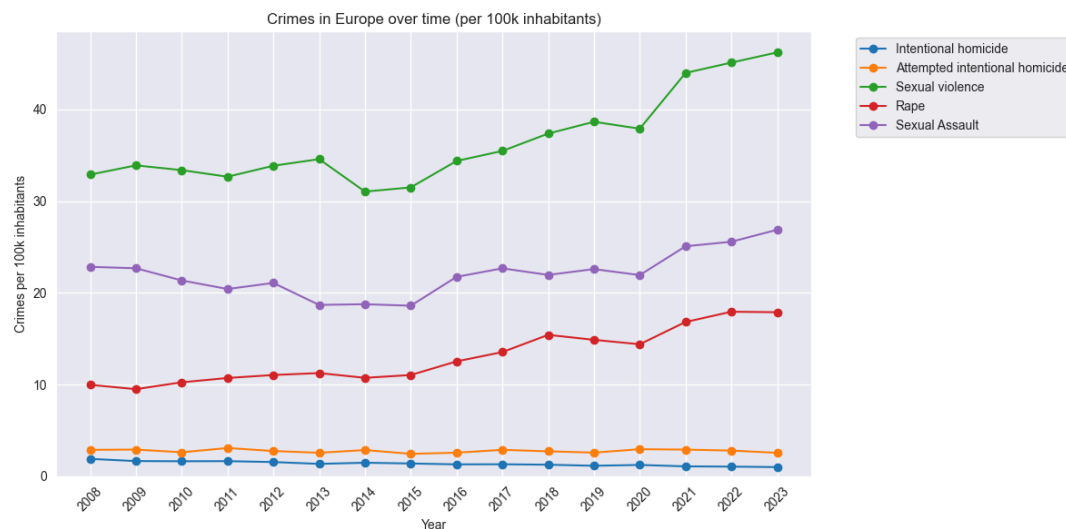

Sama heatmap Eesti kohta. (Kui veel mingi kindel riik huvitab, siis enamuse kohta need olemas.) Värvide intensiivsuse järgi näeme, et Eestis on muutused proportsionaalselt palju suuremad, kui Euroopas keskmiselt. See tuleneb sellest, et Eestis on rahvaarv palju väiksem kui kogu Euroopas. Sama loogika nagu selles, et 20->30 on 50% tõus, aga 1000->1010 on vaevu märgatav muutus.

Nii Eestis kui Euroopas seksuaalvägivald üldpildis tõuseb, üheks põhjuseks võib olla sagedasem kuritegudest teatamine, mitte tingimata kuritegude mahu tegelik tõus. Kui Euroopas üldiselt narkootikumidega seotud kuritegevus tõuseb, siis Eestis on see langustrendis.

Kõige kõrgemate numbritega kategooriad aastate kaupa (kõik riigid kokku). Pikas perspektiivis need langevad, kuigi viimastel aastatel vargused jälle tõusmas. Varguste tõus 2022 aastast võib olla seotud sellega, et maailm peale koroonat jälle avanes. Rohkem avalikes kohtades liikumist ja turismi -> rohkem võimalusi varguseks.

Veel kategooriaid, sexual violence aktiivselt tõusmas

Countries and crime categories (2.Notebook - Anastassia Käärmann)

Where is a specific crime the biggest problem, and is the situation improving or worsening over time?

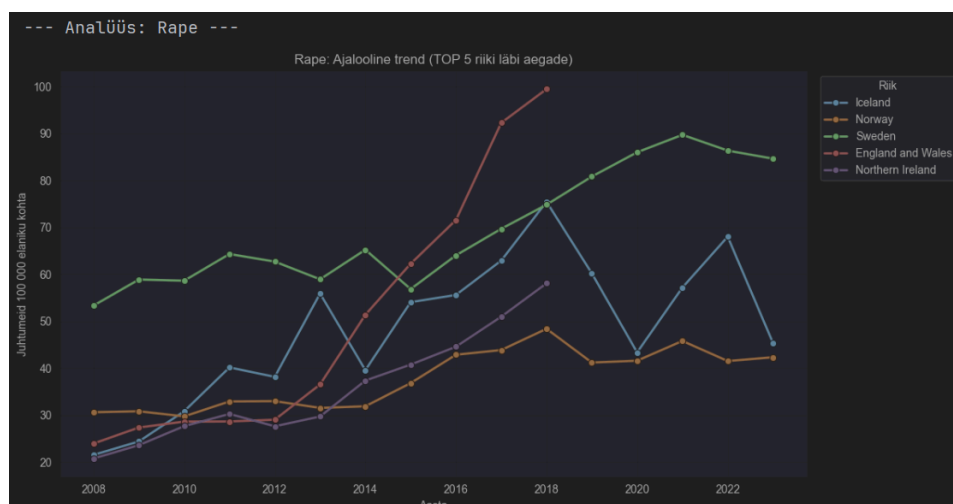

- I select the 5 countries where this specific crime is among the most significant issues and examine how the situation evolves over time: increasing or decreasing?

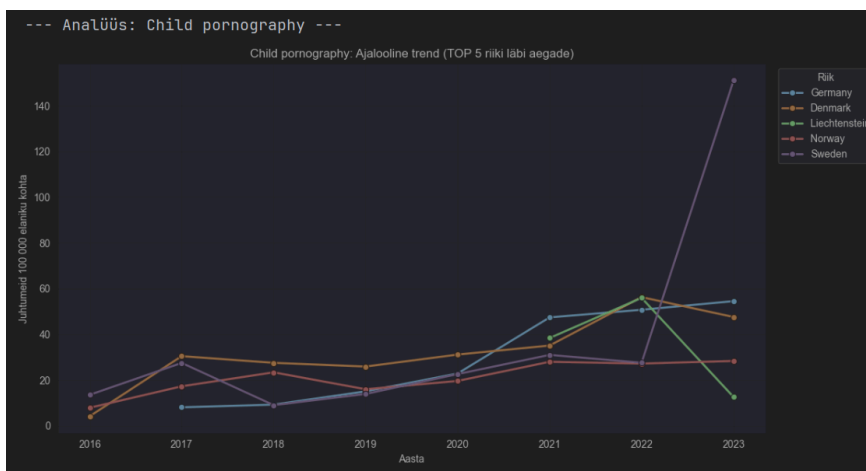

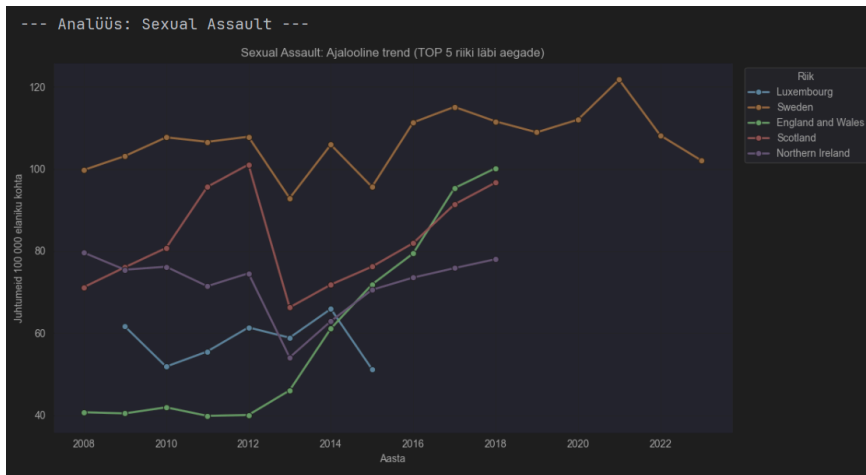

Interesting insights:

- 1) Sexual violence, rape, sexual assault, sexual exploitation, child pornography – top country → Sweden (approximately since 2021).

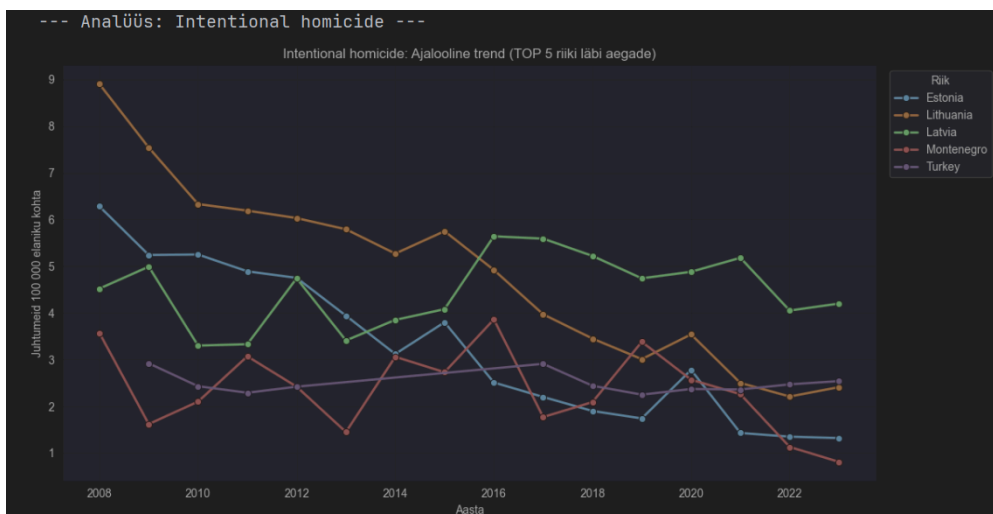

What could be the reason?

- Law change in 2018 ([2018 Consent Law](#) - this means that the prosecutor no longer needs to prove violence or threats, it is sufficient that clear consent was not present)
- The reporting culture in Sweden is different: people have a high level of trust in the police, and victims are more willing to report incidents (“Me Too” movement).
- Counting methodology.
- Immigration influx ([Link](#))

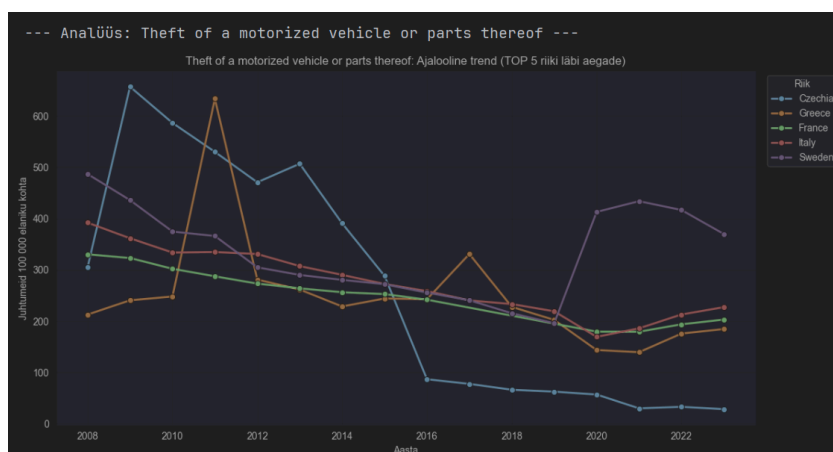

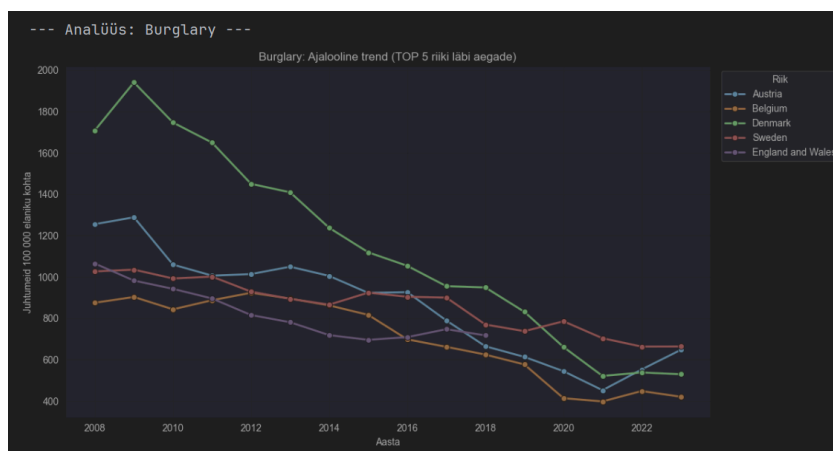

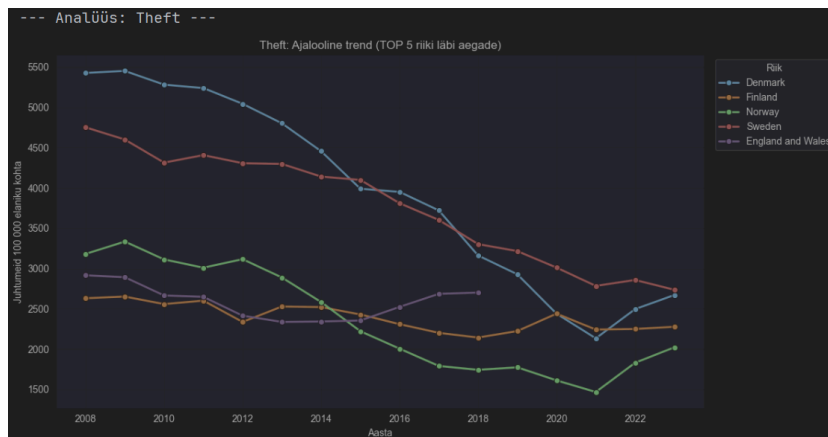

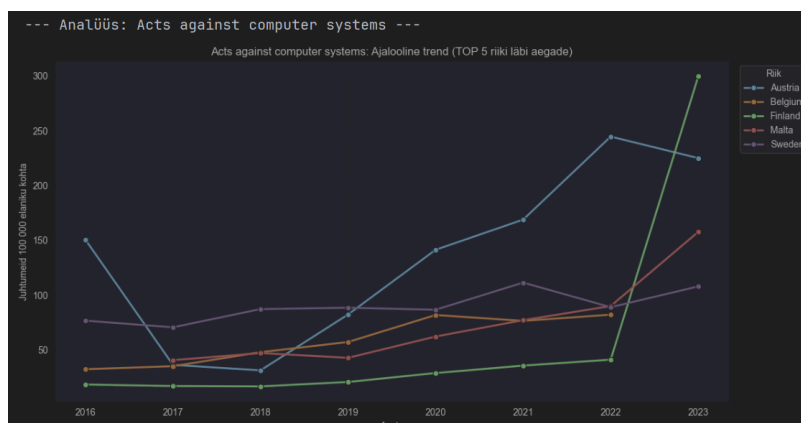

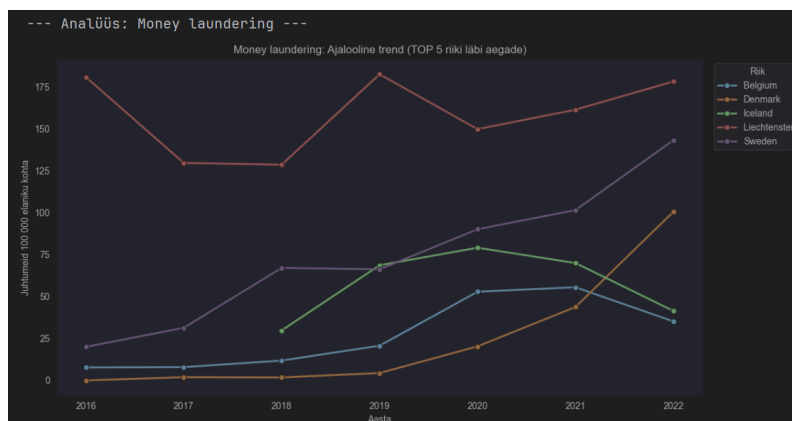

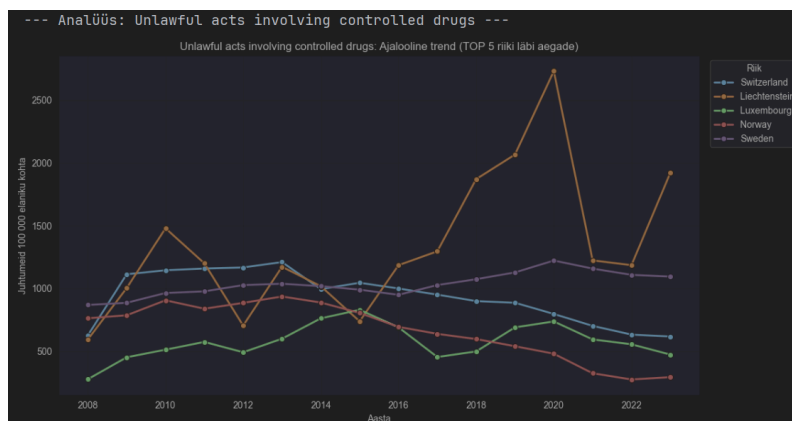

- 2) From the intentional homicide chart, it is visible that Lithuania, Estonia, and Latvia were at the top around 2008, but the trend has strongly declined since then. This may indicate societal stabilization and economic development. While homicide levels were high in Estonia and Lithuania in 2008, by 2022 the gap compared with Western Europe has significantly decreased.

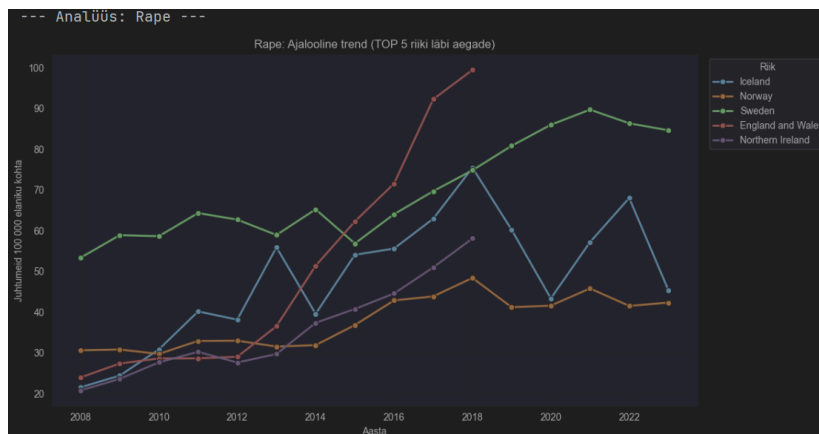

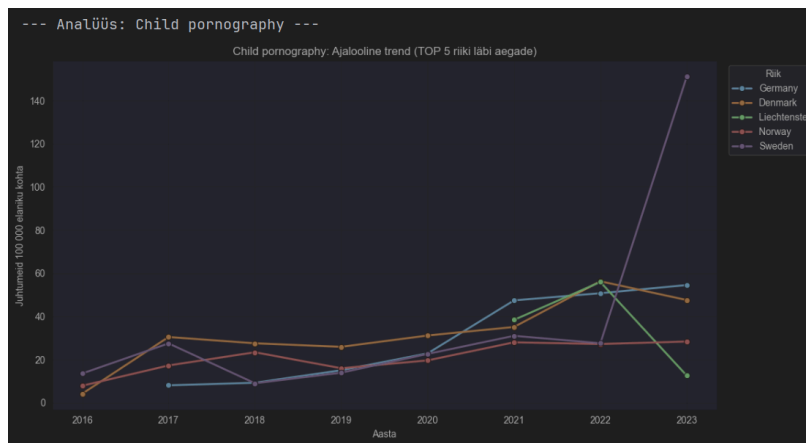

- 3) Property-related crime is generally decreasing (burglary, robbery, theft). Burglaries and robberies show a clear downward trend in almost all top-5 countries over the last 10–15 years. Why? Security technology has improved, and a cash-free society reduces incentives, people simply carry less cash. Conclusion: traditional street crime is declining in Europe. The only category showing growth is motor vehicle theft. Other fluctuations in recent years may be linked to items such as smartphones being stolen instead of cash, but the overall trend remains downward.

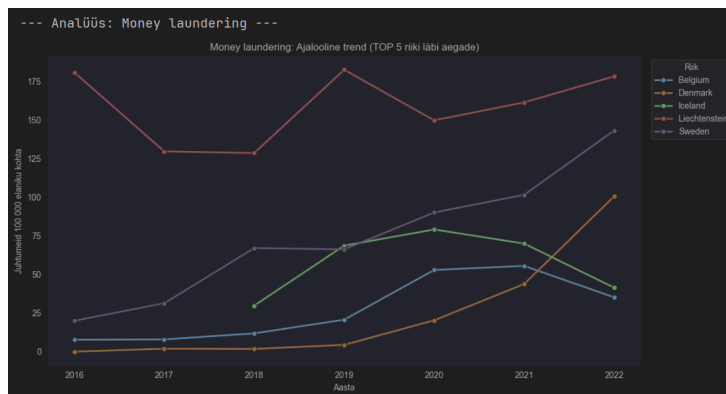

- 4) New-era crimes are on the rise, such as drugs, money laundering, acts against computer systems, child pornography, and rape. While theft-related offenses are declining, these categories are steadily increasing. Notable finding: Sweden shows an extreme jump in child pornography cases between 2022–2023. Such a sharp spike may signal a large police operation in which a major network was uncovered, pushing the statistics upward. Second notable finding: Finland shows a steep increase in acts against computer systems (2022–23). This sudden rise may be linked to a legislative change or the introduction of new detection software that allowed police to identify previously unregistered cases.

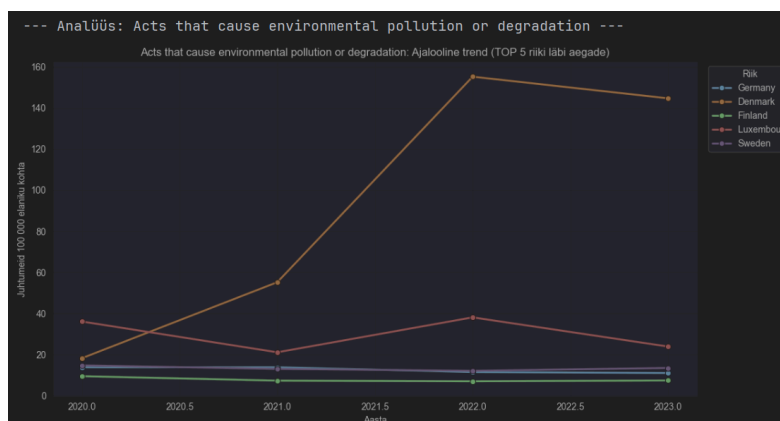

- **Acts against computer systems:** digitization shifts crime from the streets into technical systems. The more systems evolve, the easier it becomes to detect offenses using automated tools and modern monitoring solutions.
- **Child pornography:** technological capacity improves, and authorities deploy automated tools that scan the internet and identify material that previously remained hidden.
- **Money laundering:** an increase in registered cases often reflects improved banking surveillance rather than higher criminal activity. The same actions happened before, but went undetected.
- **Drugs:** market oversupply, the rise of the Dark Web and cryptocurrency-based payments move drug transactions online, making access easier. Redistribution of market share often triggers violence and stronger law-enforcement focus, which then materializes in statistics as case growth.
- **Rape:** figures increase not only due to higher case numbers, but also because legislation shifts toward consent-based definitions, and victims are becoming more willing to report incidents. The #MeToo movement (since 2017) amplified this effect. New sub-categories appear as well, such as digital sexual violence.

- 5) Data for small countries must be interpreted carefully, as it tends to be more volatile. In charts such as Money Laundering (Liechtenstein) and Attempted Homicide (Luxembourg), large fluctuations are visible. Since values are calculated per 100,000 inhabitants, already 2–3 additional cases can significantly distort the trend in small states (Liechtenstein, Luxembourg, Malta, etc.). This must definitely be taken into account.

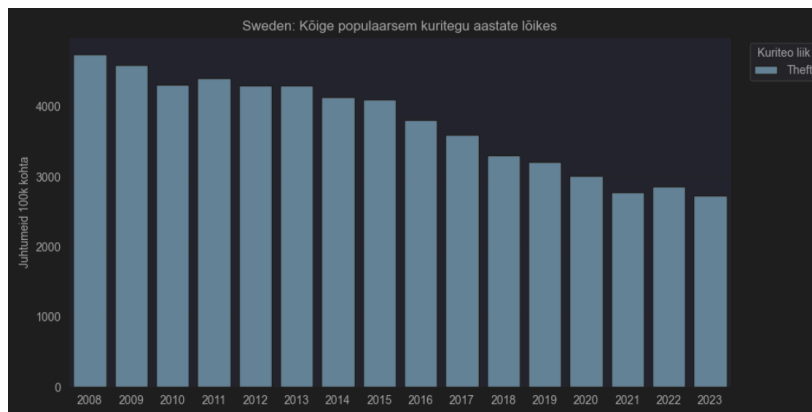

- 6) Environmental crime trends vary notably across countries. This may be related to the fact that reporting and classification of environmental offenses in Europe is still being standardized. The spike observed in Denmark may indicate a specific large pollution incident or stricter supervision in agriculture and/or industry.

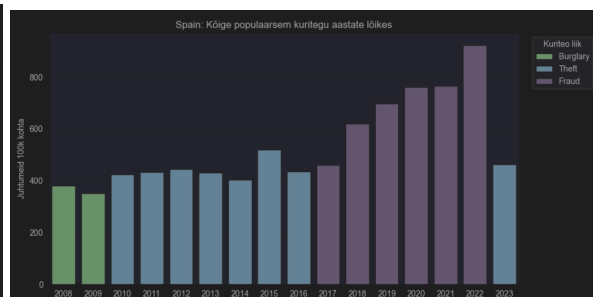

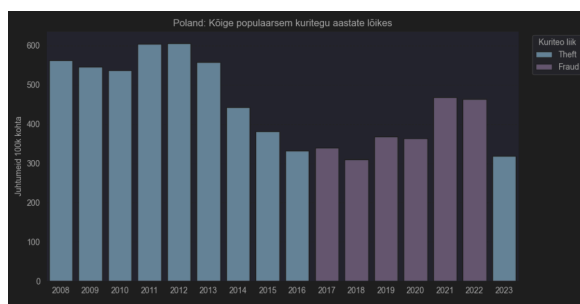

What is each country's "Crime of the Year"?

This provides a quick overview of the country's crime structure (its profile). Essentially showing what the police deal with the most.

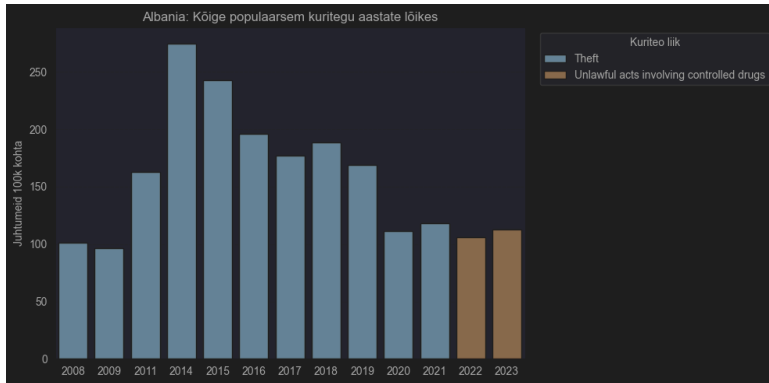

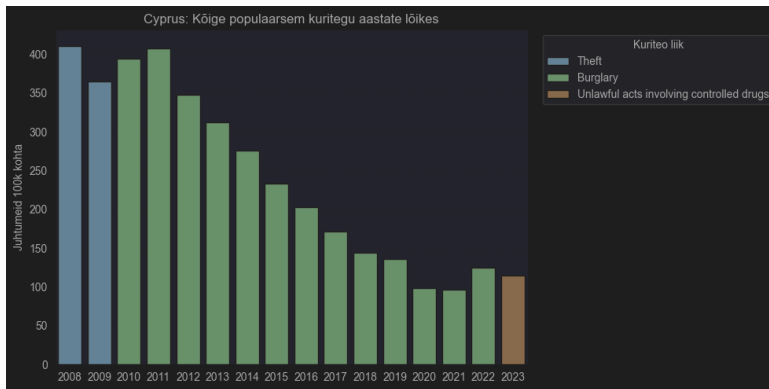

- 1) The most widespread issue in the majority of countries is Theft (significantly higher than other categories). In most countries, the situation looks as follows:

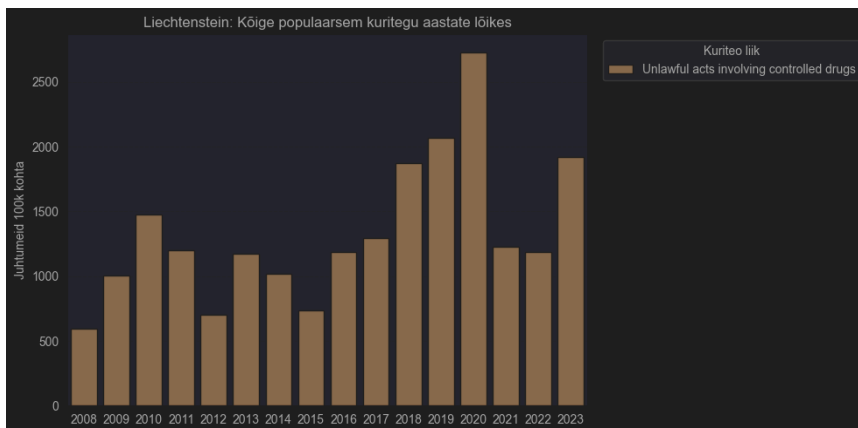

- 2) There are also signs that crime is increasingly moving online. For example, in Spain (since 2017) and in Poland (since 2021), the dominant category shifts from Theft to Fraud. While Western European countries are still largely dominated by traditional Theft, Spain and Poland show a turning point where Fraud is becoming the most prevalent crime type, pushing conventional street crime out of the top position.

- 3) Balkan and Southern specifics: In Montenegro, Croatia and Cyprus, Burglary is the dominant category. In Albania, Cyprus and North Macedonia, Drugs has risen to first place in recent years. This likely reflects police priorities rather than an actual increase in consumption.

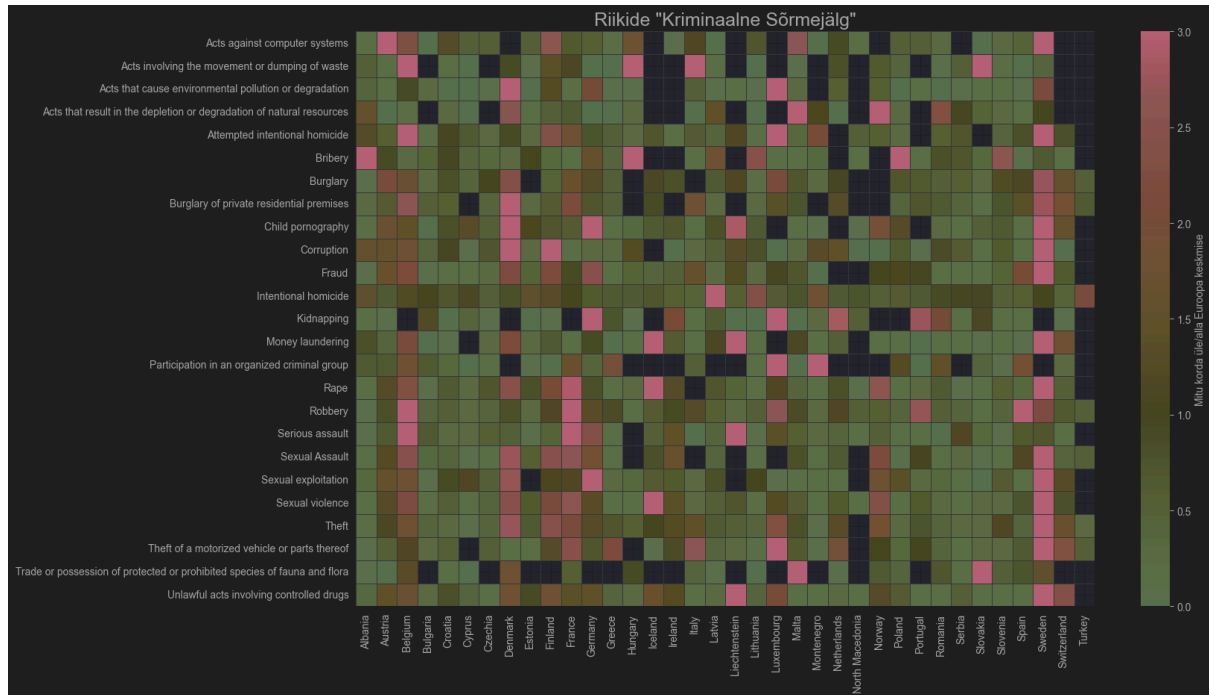

- 4) Liechtenstein – Drugs appears as the dominant category. This is a statistical anomaly. Since the population is very small, it is enough for police to check a few cars at the border and find cannabis or cocaine on tourists, and the rate per 100,000 inhabitants spikes immediately. This does not mean that Liechtenstein is a drug hotspot, but rather that effective police checks combined with a small population exaggerate the ratio.

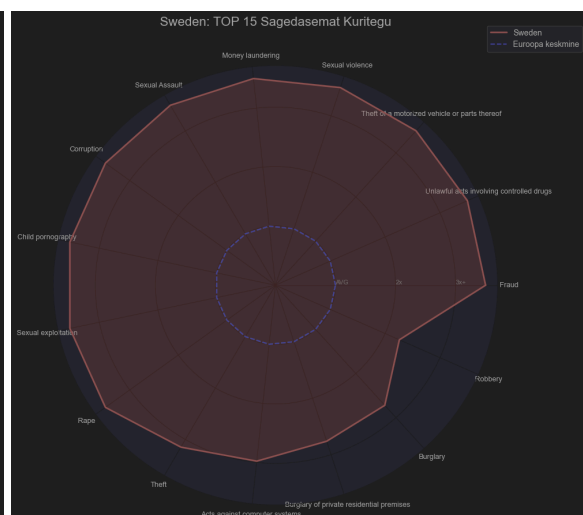

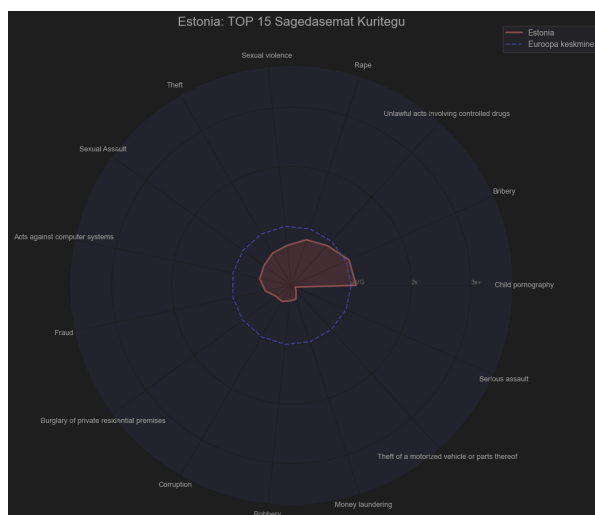

Countries' "criminal fingerprint"

In which crime types is a country unusually active compared to the European average? (Heatmap)

Deviations from the European average – Country profiles

Country crime profiles (Radar Charts): I analyze each country's unique crime structure by selecting the top 15 crime categories and comparing them with the European average.

Data analysis shows that exceeding the European average on radar charts does not automatically indicate lower safety.

Western and Northern European countries exceed the average mainly in violent and property-related crime categories, largely due to high reporting levels and broad legal definitions.

Meanwhile, Eastern and Southern European countries stand out in areas such as corruption and organized crime.

Therefore, high values on the chart do not only reflect crime prevalence, but also a country's capacity to detect, register, and process criminal activity.

Based on the information obtained from the charts, we can divide the countries into several categories:

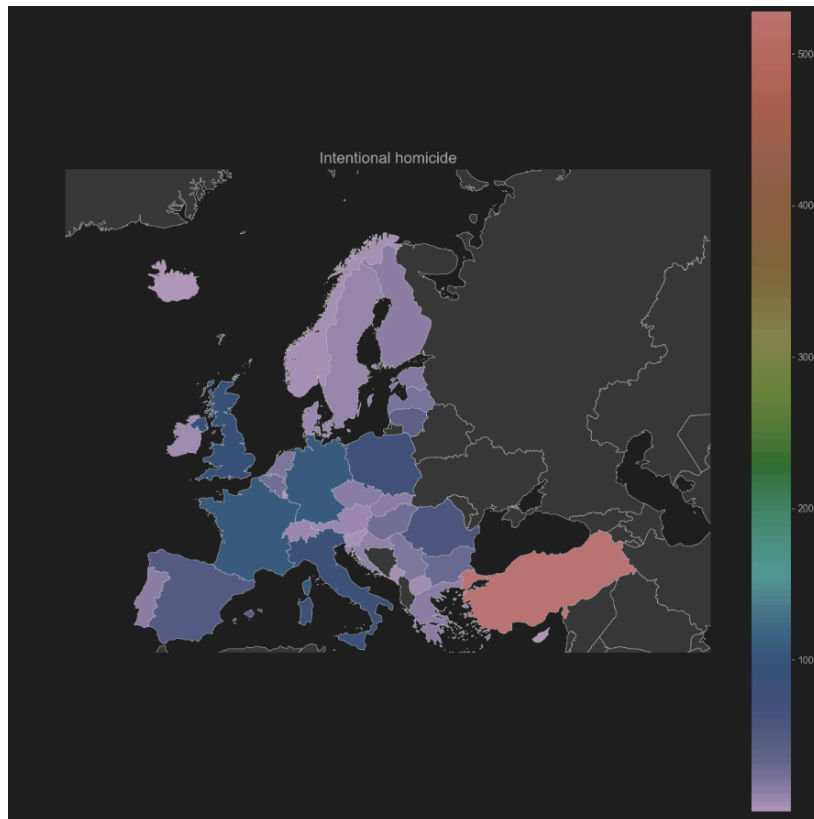

Physical Security Risk (Robbery, Serious assault, Theft, Homicide)	Belgium, France, Spain, Germany, Finland, Ireland, Luxembourg, Sweden
Institutional Risk (Bribery, Corruption, Money laundering, Organized criminal group)	Albania, Austria, Belgium, Denmark, Greece, Hungary, Liechtenstein, Luxembourg, Montenegro, Sweden
High Social Sensitivity Profile (Rape, Sexual violence, Sexual assault)	Sweden, Norway, Luxembourg, Ireland, Iceland, Germany, France, Denmark, Belgium, Austria

(based on European average)

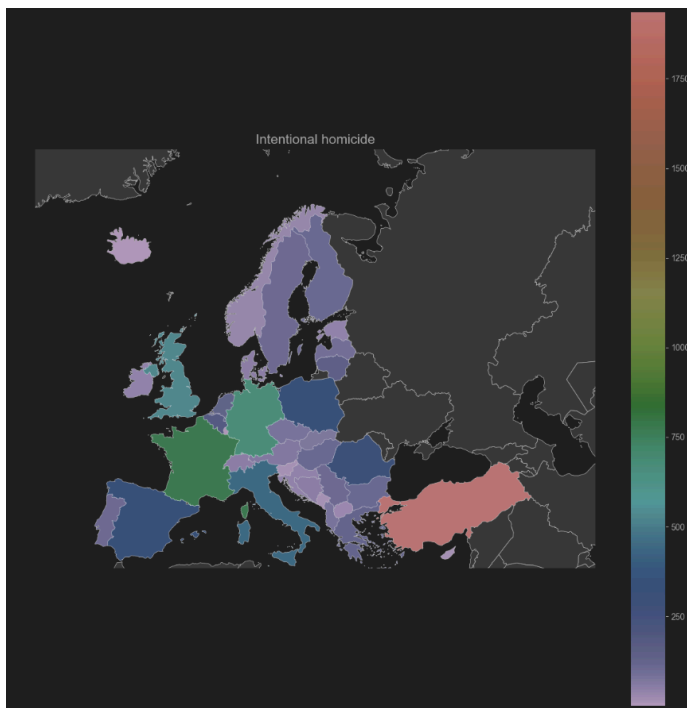

Riigid ja regioonid (3. Notebook - Helena Angela Kiisler)

Kuidas on läbi ajaloo muutunud kuritöö kuumimad kohad?

1993-2007 (juhtumiste arvu järgi)

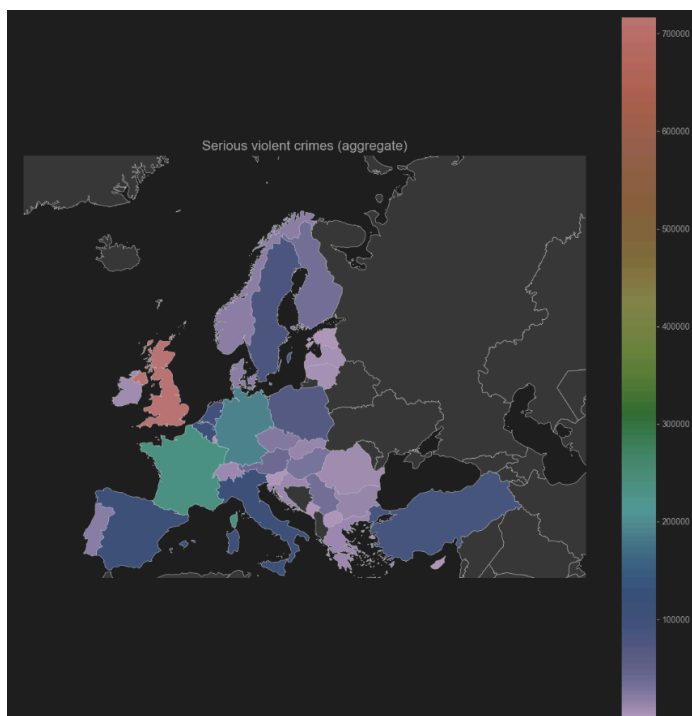

2008-2023

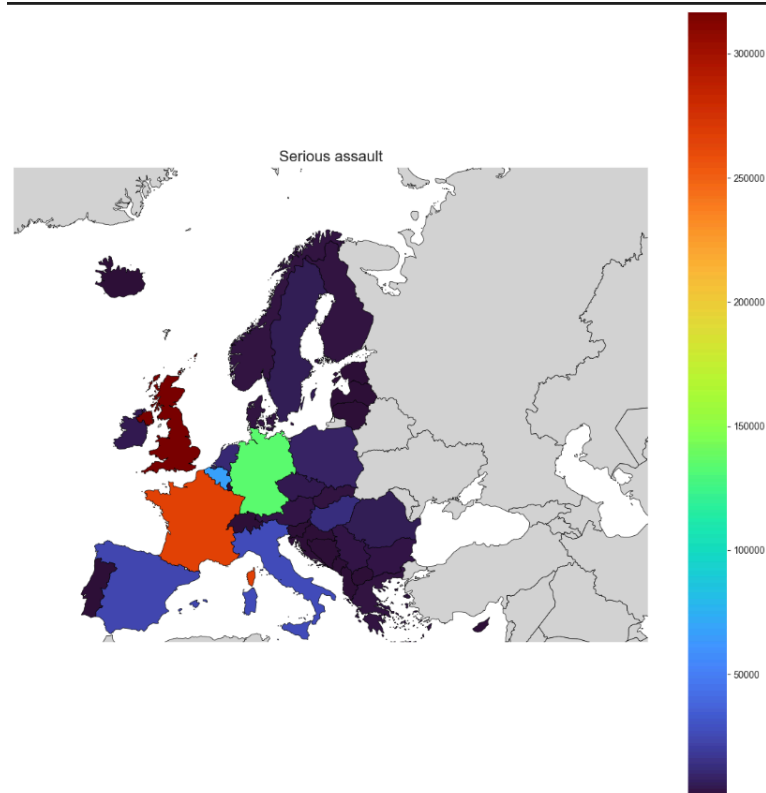

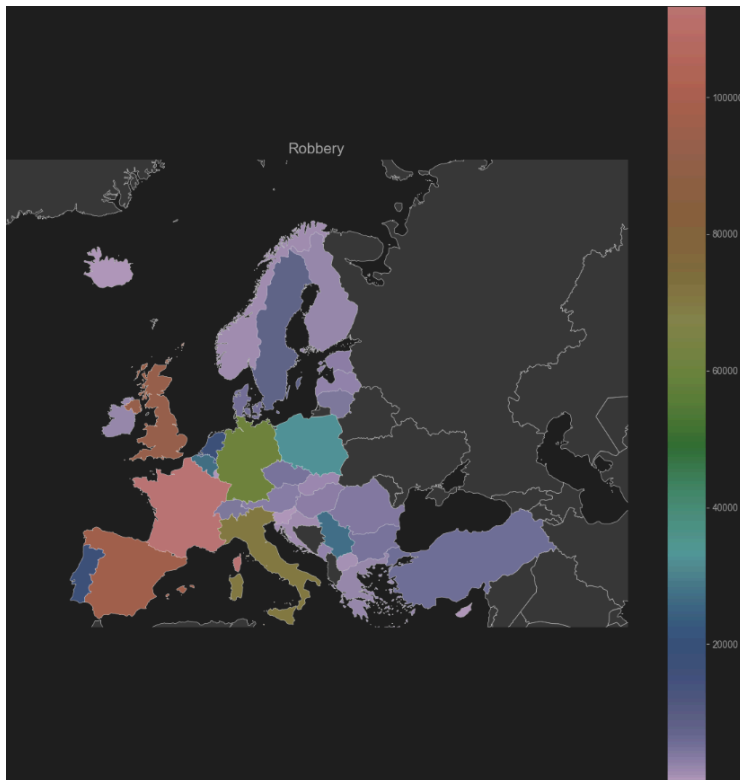

Mõlemal ajavahemikul on näha, et Türgis on mõrva juhtumeid kõige rohkem, kuid arv ise tegelikult langeb. Kui ajavahemikul 1993-2007 oli türgis neid keskmiselt üle 5000, siis aastatel 2008-2023 langeb see ~1800 kanti.

1993-2007

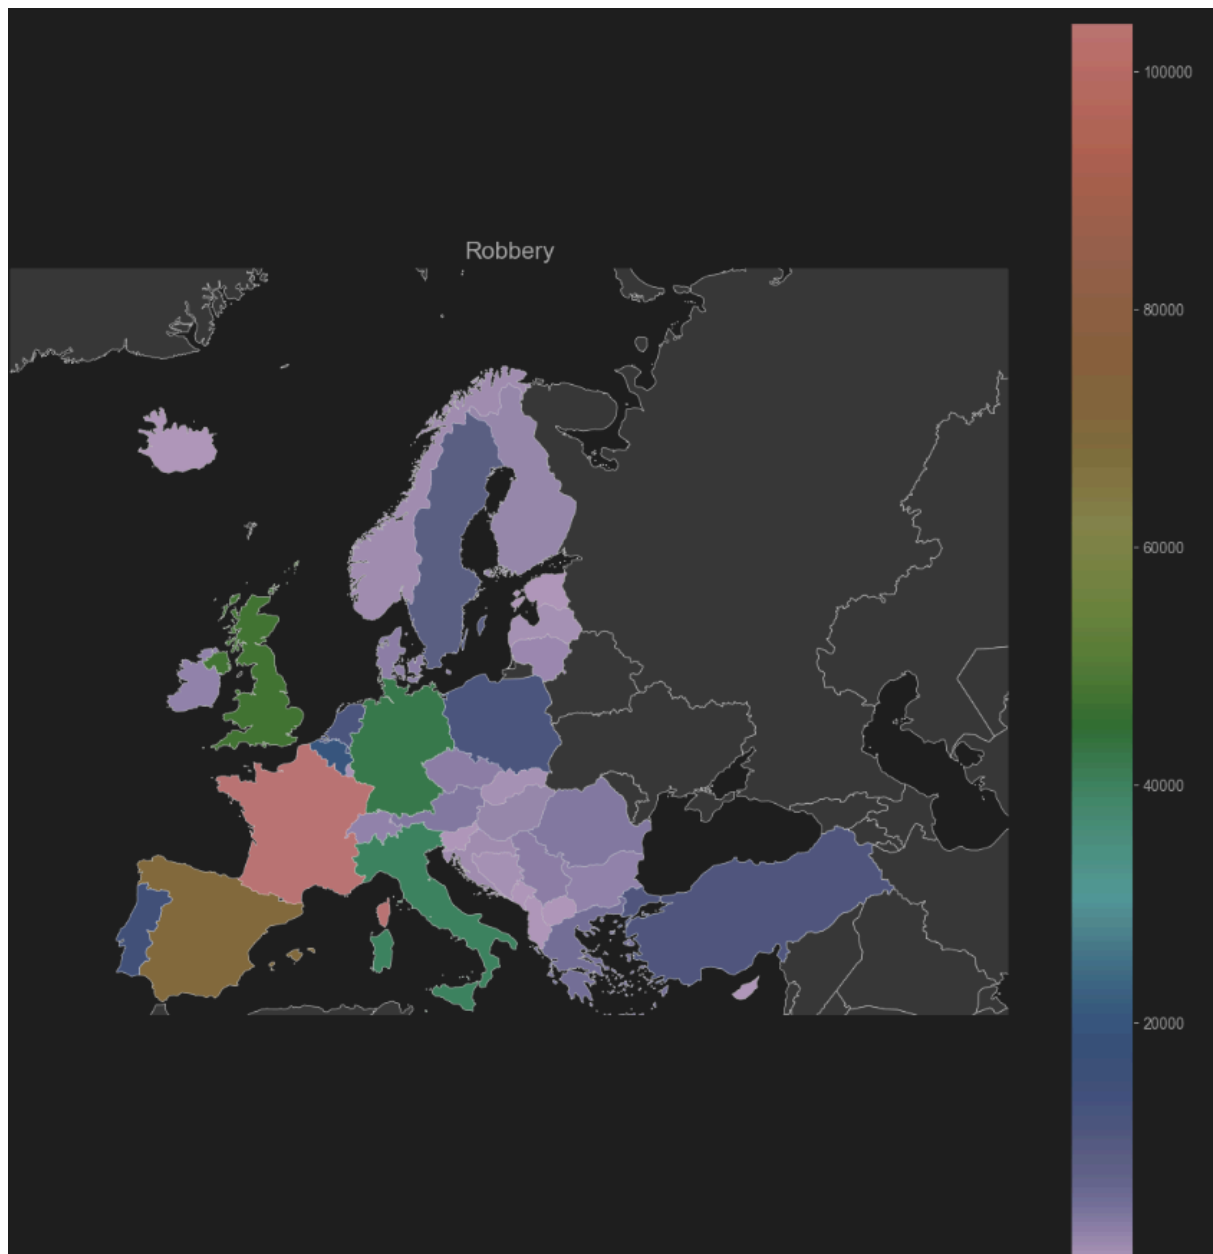

1993-2007

2008-2023

Näeme, et ajavahemikul 1993-2007 on riikides Hispaania ja Suurbritannia röövimiste arv keskmiselt 100tuh juhtumit aastas, kuid 2008-2023 langeb see keskmine Suurbritannias 50tuh juurde ehk poole vähemaks ning Hispaanias ~70tuh juhtumi juurde. Samas Prantsusmaa röövimiste arv jääb keskmiselt jätkuvalt väga kõrgeks nimelt 100tuh juurde
